

## Current Radar and Satellite Data

## Today and Tomorrow's Weather

As several low pressure systems propagate across the continent, the Gulf of Mexico will hold onto locally high pressure. Tomorrow the tail end of a cold front may drag through the northern Gulf and bring thunderstorms, but the majority of all activity should remain onshore. Moderate to fresh southerly breezes will continue today and tomorrow. Areas to the far west may have a more southwesterly direction and to the east areas may have a more southwesterly wind. Seas will remain between 5-6 feet.

## Day Three through Seven Weather Hazards

Variable conditions are going to set in across the Gulf this weekend with multiple areas of high and low pressure passing nearby. First an area of low pressure along the Mexico Coast will travel south into the Bay of Campeche. The area of low pressure and cold front will exit the northern Gulf Friday, leading to high pressure across the Gulf Coast. Aside from some potential thunderstorms in the northern Gulf Friday with the cold front, dry conditions are expected. Winds will be variable, but generally remain in the moderate range. Seas will remain near 4 feet into next week. Into next week a more prominent area of low pressure is forecast to move along the Gulf Coast and bring thunderstorms and elevated winds to the northern Gulf.
